

Release Notes

5000 series v4.7.7

23 Sept 2025

New firmware for the 5000 series

DATAMARS
Livestock™

Release date: 24 Sept 2025

Version number 4.7.7

What's included?

- ✓ Bluetooth Low Energy enabled for iOS connections
- ✓ Chinese language

Bluetooth Low Energy

DATAMARS
Livestock™

Bluetooth Low Energy connections are now available on the 5000 series indicators with this new firmware.

This allows for herd management software (such as AgriWebb, TagMax, Herdwatch, Breedr etc) to connect to the 5000 series on iOS devices as well as Android.

We will be sending out an email to our known integration partners that have integrated with the 5000 series and EziWeigh7i to notify them of this new integration method.

The integration partners will need to update their software to enable BLE connection on their iOS and android applications. This will take time for the integration partner to schedule the development, test, and release on their side.

Chinese language added

DATAMARS
Livestock™

Chinese language has been added to the 5000 series indicators.

Note: This is only for the display as the input is still with the Latin characters.

For customers currently using the 5000 series in English and want to change to the Chinese language, they need to update to this new firmware, then go to settings, general, and change the language. The indicator will restart with the new language displayed and no loss of data.

Previous Releases Summary

- Version 4.6.4, Released August 2025
 - Draft direction count increased to support 5 digits
